

INSTALLATION INSTRUCTIONS FOR DRAIN VALVE FOR CONTAINMENT BERMS

The installation of a drain valve is a quick and easy process. Just follow these instructions and the job should be done in about 15 minutes.

- 1) Determine the best location for the drain fitting. The fitting should be placed at the low end of the unit where unwanted water is collecting. Also be sure that the valve is placed in a no traffic location.
- 2) Trace the valve at its desired location.
- 3) Cut a hole that is smaller than the valve itself. Push the valve through the hole. REMEMBER - cut the hole smaller. If you need to expand it, this is possible.
- 4) Pass the fitting through the hole and seal it with the included washer and nut.
- 5) See diagram below for more information
